

Rack Mount Guide

Using rack mounts when installing power cables:

The Datacom rack mounts all come with pairs of holes located in the back. These holes can be used to neatly and efficiently direct the power supply cables and to keep them secure.

Once the Datacom device has been installed in the rack mount, connecting power cables is often the next step (on powered devices).

Connect the power cords to the back of the device. Direct the cords to the left as shown in the picture.

Fish a cable tie through the holes in the rack mount and tie it together. Make sure that the power supply cables are between the holes before fully tightening the cable tie.

Cut the excess plastic of the cable tie once it has been fully tightened. This allows the power cables to remain secure to the rack mount.
